

Challenges and Required Capacities for Refrigeration Sector

Role of Tertiary Institutions and Universities in HCFC Elimination

Abstract

Labor markets usually determine the way Universities respond to challenges in the work place by providing new programs and / or courses. This is relevant to Climate change in general and HCFC elimination in particular.

This elimination of HCFC in refrigeration systems offers many opportunities for learners, academics, institutions and society. However there are many challenges associated with each sector. This presentation will consider various challenges facing each sector and consider and assess strategies to overcome these challenges. It will also suggest areas of opportunities that education can bring to the table to protect the environment.
